| Regarding 2015 USTS: "This survey used convenience sampling, a methodology which generates low-quality data (Bornstein, Jager, & Putnick, 2013). Specifically, the participants were recruited through transgender advocacy organizations and subjects were asked to "pledge" to promote the survey among friends and family. This recruiting method yielded a large but highly skewed sample." D'Angelo, R., Syrulnik, E., Ayad, S. et al. One Size Does Not Fit All: In Support of Psychotherapy for Gender Dysphoria. Arch Sex Behav (2020). https://doi.org/10.1007/s10508-020-01844-2 Citing: Bornstein, M. H., Jager, J., & Putnick, D. L. (2013). | Carmichael, UK Tavistock/GIDS study 2020: "Short-term outcomes of |
| pubertal suppression in a selected cohort of 12 to 15 year old young |
| people with persistent gender dysphoria in the UK." |
| "Results 44 patients had data at 12 months follow-up, 24 at 24 |
| months and 14 at 36months. All had normal karyotype and |
| endocrinology consistent with birth-registered sex. All achieved |
| suppression of gonadotropins by 6 months. At the end of the study |
| one ceased GnRHa and 43 (98%) elected to start cross-sex |
| hormones. |
| There was no change from baseline in spine BMD at 12 months nor |
| in hip BMD at 24 and 36 months, but at 24 months lumbar spine |
| BMC and BMD were higher than at baseline (BMC +6.0 (95% CI: 4.0, |
| 7.9); BMD +0.05 (0.03, 0.07)). There were no changes from baseline |
| to 12 or 24 months in CBCL or YSR total t-scores or for CBCL or YSR |
| self-harm indices, nor for CBCL total t-score or self-harm index at 36 |
| months. Most participants reported positive or a mixture of positive |
| and negative life changes on GnRHa. Anticipated adverse events |
| were common. |
| Conclusions Overall patient experience of changes on GnRHa |
| treatment was positive. We identified no changes in psychological |
| |

| Green, et al (2020). The Trevor Project conducted an on-line survey recruiting adolescents and young adults (AYA) who experienced "sexual orientation or gender identity conversion efforts (SOGICE)" and "who interacted with materials deemed relevant to the LGBTQ community." Exclusion. This design excludes AYAs who do not or no longer identify as LGBTQ nor interact with the LGBTQ community or its materials, such as those who found therapy helpful. By excluding them it can make no conclusions about them. Bias. Prior to survey "questions specific to youth mental health and suicidality," the LGBTQ-identified AYAs were instructed to contact the Trevor Project crisis intervention hot line if needed, thus revealing the study sponsors and their well-advertised biases. Bias. Green's study defined SOGICE as coercive, "someone attempted to convince them to change," which ethical change- allowing therapists don't do. Excluded 105 participants who said they experienced SOGICE but without someone trying to "convince them change," so it can claim nothing about non-coercive SOGICE. | Green, et al (2020). Trevor Project. Green, A.E., Price-Feeney, M., Dorison, S.H., Pick, C.J. (2020). Self-reported conversion efforts and suicidality among US LGBTQ youths and young adults,2018. American Journal of Public Health, Open-Themes Research, 110(8), 1221-1227. https://ajph.aphapublications.org/doi/abs/10.2105/AJPH.2020.3057 01 The Trevor Project conducted an on-line survey recruiting adolescents and young adults (AYA) who experienced "sexual orientation or gender identity conversion efforts (SOGICE)" and "who interacted with materials deemed relevant to the LGBTQ community." Cross sectional, retrospective. By definition, neither the presence nor direction of causation can be determined, but they do it anyway. "Although noteworthy, our findings involve limitations that should be considered. For example, our data were cross sectional; thus, temporality cannot be determined." Exclusion. |--|---|
| Pediatrics Feb 2020, 145 (2) e20191725; DOI: 10.1542/peds.2019- 1725 "Using a cross-sectional survey of 20 619 transgender adults aged 18 to 36 years" [2015 U.S Transgender Survey. Online survey of transgender and "genderqueer" adults recruited from trans-friendly websites.] Retrospective, cross-sectional ("cross-sectional design, which does not allow for determination of causation."). Self-reporting of history of adolescent puberty suppression. Not controlled for other mental health factors. "it is plausible that those without suicidal ideation had better mental health when seeking care and thus were more likely to be considered eligible for pubertal suppression." Those with worse mental health would often be denied puberty blockage Desisters and regretters would not likely be in this study group, which also only included adults, so "it does not include outcomes for people who may have initiated pubertal suppression and subsequently no longer identify as transgender." A very limited group of respondents. "those who received treatment with pubertal suppression, when compared with those who wanted pubertal suppression but did not receive it, had lower odds of lifetime suicidal ideation (adjusted odds ratio = 0.3; 95% confidence interval = 0.2– 0.6)." This was one measure of 9 that were evaluated, the only positive result reaching statistical significance. | Transgender Fournand Risk of Succidan Ideation. Fediatrics Feb 2020, 145 (2) e20191725; DOI: 10.1542/peds.2019-1725 "Using a cross-sectional survey of 20 619 transgender adults aged 18 to 36 years"[2015 U.S Transgender Survey. Online survey of transgender and "genderqueer" adults recruited from trans-friendly websites.] Retrospective, cross-sectional ("cross-sectional design, which does not allow for determination of causation."). "pledge" to promote the survey among friends and family. This recruiting method yielded a large but highly skewed sample." Section "Invalid Measure of Gender Conversion Therapy" re USTS question 13.2: "Firstly, the question conflates mental health encounters with interactions with other types of professionals. Secondly, there is no information about whether the recalled encounter was self-initiated or coerced. Thirdly, it does not differentiate between diagnostic evaluations or a specific therapeutic intervention. There is also no information about whether the focus of the encounter was gender dysphoria or another condition. And finally, it does not determine whether shaming, threats, or other unethical tactics were utilized during the encounter."

"Their analysis is compromised by serious methodological flaws, including the use of a biased data sample, reliance on survey questions with poor validity, and the omission of a key control variable, namely subjects' baseline mental health status." Misinterpretation of K-6 scale. "The K-6 scale, and its cutoff score of ≥ 13, was specifically developed by Kessler et al. (2003) in order to discriminate

between cases of non-specific psychological distress and cases of serious mental illness (SMI). Scoring \geq 13 is predictive of having a DSM diagnosis of schizophrenia, bipolar disorder, and a range of other major mental health conditions that cause serious functional impairment (Substance Abuse

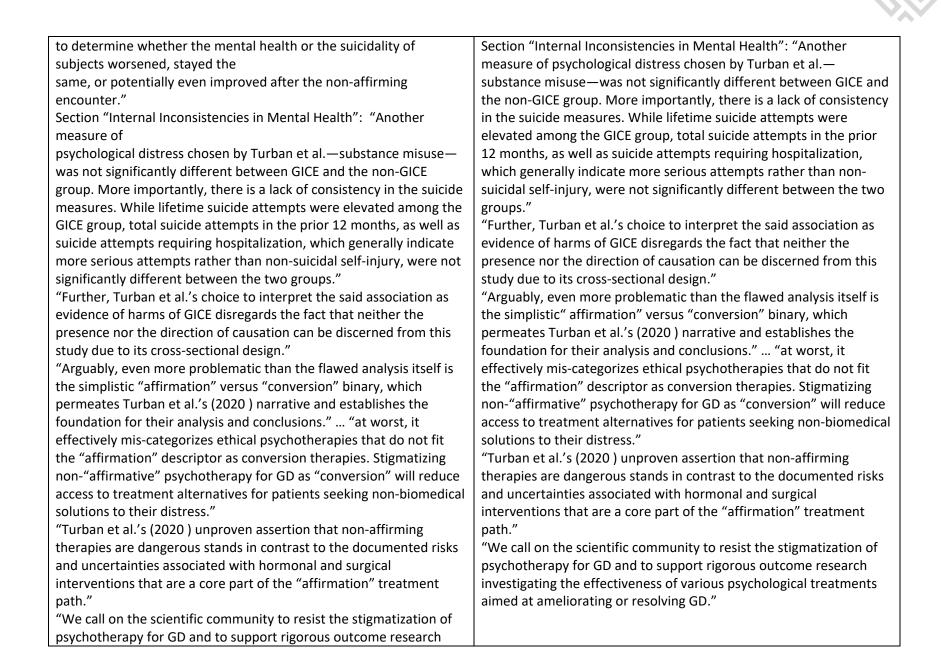

and Mental Health Services Administration, 2020). Thus, Turban et al.'s (2020) finding of an association between the recall of GICE and scoring ≥ 13 actually suggests that the USTS participants recalling GICE were more likely to have a severe mental illnesses diagnosis than those not recalling GICE."

Section "Omission of a Key Control Variable": "In fact, failure to control for the subjects' baseline mental health makes it impossible
